

VA RN Assessment Quiz: athenaOne Triage, Chart Prep, and CCM Documentation

1. Quiz Overview and Instructions

This quiz evaluates the Virtual Assistant RN's proficiency in utilizing the athenaOne platform for clinical triage, remote patient preparation, and Chronic Care Management (CCM) within the Prima Medicine clinical workflow. As a remote nursing lead, your ability to troubleshoot technical barriers and optimize encounter efficiency is vital to maintaining schedule density and high-quality patient outcomes. **Instructions:** Select the single best answer for each scenario based on athenaOne standard operating procedures and Prima Medicine's service offerings.

2. Scenario 1: Virtual Visit Troubleshooting (Triage)

Scenario: A patient named "Lola" is attempting to join a virtual visit with Dr. Joseph Connor. During the "Device Check" phase, she reports that she has clicked the "Play Sound" button for the Speaker Test but cannot hear the test tone. **Based on the "Troubleshoot your speakers" guide, which step represents the appropriate first-line troubleshooting intervention for the RN to provide?**

- **A.** Instruct the patient to verify that the device volume is elevated and that the software toggle is not set to mute.
- **B.** Advise the patient to refresh the browser tab using the (cmd + R) command to reset the session hardware permissions.
- **C.** Direct the patient to the system settings to ensure the "Default Microphone" is correctly mapped to the hardware.
- **D.** Instruct the patient to exit the browser and reopen the link in an Incognito or Private browsing window.

3. Scenario 2: Pre-Encounter Chart Prep (Efficiency)

A patient is scheduled for a Medicare Annual Wellness Visit at the Fairfax location. To minimize provider distractions and satisfy value-based care requirements during the intake process, which specific action should the RN perform within the athenaOne "pre-encounter prep" feature?

- **A.** Automate the coding of HCC RAF gaps during the intake window to bypass clinical documentation.
- **B.** Pull key clinical tasks directly into the intake process for completion prior to the provider's arrival.
- **C.** Schedule the patient's six-month follow-up appointment within the current intake window.
- **D.** Delete previous encounter notes to ensure the current chart is clear of historical clinical data.

4. Scenario 3: Chronic Care Management (CCM) Identification

Scenario: While triaging the clinical inbox, the RN identifies a patient with multiple chronic conditions (e.g., Diabetes and High Blood Pressure) listed in the Prima Medicine "Medicare" service menu. **Based on the "When to Consider Telemedicine" guidelines, which task is most appropriate for a virtual Chronic Care Management (CCM) follow-up?**

- A. Physical examination for an acute orthopedic injury.
- B. Medication refills and management of chronic conditions.
- C. Medical laboratory testing for immigration physical requirements.
- D. X-Ray imaging for suspected bone fractures or alignment checks.

5. Scenario 4: Eligibility and Inbox Triage (Administrative/Clinical Intersection)

While monitoring the athenaOne clinical inbox, the RN identifies a flag indicating "missing or inaccurate eligibility information" for an upcoming appointment. According to the *athenaOne Demo* transcript, what is the primary objective of resolving this flag before the encounter?

- A. To increase practice visibility and social media engagement for the Fairfax location.
- B. To automate text message reminders for the patient's future wellness visits.
- C. To prevent financial leakage by resolving issues that drive denied claims.
- D. To allow the patient to bypass the virtual registration and device check phases.

6. Scenario 5: Virtual Visit Documentation and Relationship Roles

Scenario: A participant is joining a virtual visit via the Patient Portal. The participant confirms they are not the patient but are instead the patient's "caregiver." **Which specific workflow step must the participant complete in the athenaOne interface to ensure their "participant title" is documented correctly in the visit window?**

- A. They must select "No, I am a caregiver" from the relationship dropdown menu after entering their name.
- B. They must select "Yes, I am the patient" to ensure the system does not terminate the connection.
- C. They must type their relationship title into the "Settings" menu under the "Background" tab.
- D. They must wait for the provider to manually change their title once the encounter has commenced.

7. Answer Key and Clinical Rationales

Question Number, Correct Answer, Rationale

1,A,"According to the athenaOne Virtual Visit Patient Workflow guide, initial triage of peripheral audio output issues begins with verifying that volume is up and the speakers are not set to mute. Note: Refreshing the browser (cmd+R) is a specific fix for microphones, not speakers."
2,B,"As detailed in the athenaOne Demo transcript, the pre-encounter prep feature allows staff to pull key clinical tasks into the intake process. This minimizes distractions for the provider and ensures compliance with value-based care requirements."

3,B,"Based on the ""When to Consider Telemedicine"" source, virtual visits are highly effective for medication refills and management and chronic condition management because these encounters typically do not require a physical examination."

4,C,"The athenaOne Demo transcript explains that the platform flags eligibility issues so staff can follow up and prevent a denied claim down the line, which is a primary driver of financial performance for the practice."

5,A,"Per the athenaOne Virtual Visit Patient Workflow (Accessing via Patient Portal), a participant who is not the patient must enter their name and select their relationship from the dropdown menu (e.g., ""No, I am a caregiver"") to be documented with the correct participant title ."
